Finding the Software Version on an Eos Family Console (Prior to v2.3.3)

The process below is applicable to all Eos Family consoles (Eos Classic, Ion, Element, Gio, Eos Ti, Eos Family RPU, Net3 RVI, ETCnomad, ETCnomad Puck, Gio @5, Ion Xe, Element 2)

The software version of the console software is a six digit number, separated by decimal points. For example, the below screenshots show version 1.9.6.9.0.3. This can also be abbreviated as 1.9.6, Build 3.

The version number of the console can be found in two places.

1. While booting, the console splash screen will display the version information

2. When fully launched into the software, clear the command line and press [About]. The version number will be displayed to the right of the logo.

While there is version information present in the shell under Settings -> General, this information reflects other pieces of software that do not always change with updated software. The above two methods are the best ways of confirming your software version.
For information on updating your console, please see the following article: <<Updating Eos Family Software>>
